

3-2-1" is a commonly used backup strategy that ensures data protection and recovery in the event of data loss or disaster. The strategy is based on three key principles:

Three copies of your data: This means that you should have at least three copies of your data, one primary and two backups, stored in different locations to ensure redundancy.

Two different storage media: This means that you should store your data on at least two different types of storage media, such as hard drives, tapes, or cloud storage. This provides protection against failures or issues with a single storage medium.

One off-site backup: This means that at least one backup should be stored off-site, preferably in a different geographic location. This provides protection against disasters or events that may affect your primary location, such as fire, flood, or theft.

By following the 3-2-1 backup strategy, organizations can ensure that their data is protected and can be recovered in the event of data loss or disaster.
